

GEN II Drop base air cleaner.

Part# EP-401

Part# EP-402

This drop base air cleaner allows the Trans Am shaker scoop to be used with taller manifolds. The EP-401 is made for 1"- 1 3/8" taller than stock applications, such as Edelbrock Performer RPM or carburetor spacers.

NOTE: Edelbrock Performer RPM intake manifold is 1 1/4" taller than stock.

Due to variations between other aftermarket components and the deep drop of the base around the carburetor the installer must check for clearance with throttle linkages, fuel lines and other possible interference and take appropriate steps to correct.

Air cleaner spacers are available to help increase clearance BUT will reduce scoop to hood clearance.

- Quadrajet carburetors.

Some Q-jet carburetors have a vent stack that will require a hole to be drilled in the GENII air cleaner base, this hole can not be done prior to shipping due to the various vent locations.

This is simple to do by placing the base over the carburetor and pressing down for the steel vent tube to leave an imprint in the aluminum base, this imprint serve as a reference to drill the appropriate vent hole, we suggest using a step drill bit for a this as it will make a nice round burr free hole.

Some models of Q-jets have a forward facing inlet fuel line with a large fitting, clearance with this large fitting is very tight it is possible to replace the fitting with a shorter fitting Dorman part# 55140 there are also after market AN fitting available.

The EP-402 drop base is for up to 1/2" taller applications and allow a much larger filter to be employed.

The EP-402 is also a deep drop base and clearances should be checked as mentioned above.

NOTE

These drop bases **WILL NOT** fit on Edlebrock , AFB with electric chock

The EP-401 can be made to fit with an air cleaner spacer if used on a STOCK height manifold
